

Microstructure-Based Fair Value and Intraday Statistical Arbitrage in XLK

Final report: negative tradable result under incomplete-basket implementation

The active sparse microprice-signal strategy is positive in the January-February selection period but fails in the March out-of-sample period once executable midpoint P&L; and bid-ask costs are imposed. The no-trade benchmark is the best honest March decision.

Conclusion

The proposed ETF-basket arbitrage fails under the available eight-name proxy basket. Microprice is useful as a fair-value signal and diagnostic input, but the executable out-of-sample strategy does not beat no-trade after costs.
